

Web Marketing Dashboard Analysis

Problem & Background Statement

In the modern digital ecosystem, businesses rely heavily on their websites as the primary channel for customer acquisition, engagement, and conversion. Every click, pageview, and session generates data that can reveal valuable insights into user behaviour. However, the challenge lies in making sense of this data. Raw numbers alone do not provide clarity; they need to be structured, visualized, and contextualized to inform strategic decisions.

One of the most pressing issues in web marketing is the fragmentation of data across multiple sources. Traffic may come from organic search, paid campaigns, referrals, or direct visits, each with its own performance dynamics. Without a consolidated view, marketers struggle to identify which channels are most effective, which pages drive engagement, and where users are dropping off. Additionally, the absence of real-time visibility into KPIs can delay corrective actions, leading to missed opportunities.

Stakeholders

The dashboard was designed to meet the needs of four primary stakeholders:

- **Marketing Manager:** Focused on campaign ROI and traffic acquisition, requiring insights into channel performance and bounce rates.
 - **Content Strategist:** Interested in page-level engagement, using metrics like time on page and exits to guide content planning.
 - **SEO Analyst:** Monitors organic traffic and keyword performance, relying on source/medium data and bounce rates to refine SEO tactics.
 - **Country Manager:** Oversees regional performance, analyzing user behavior by geography and device category to tailor local strategies.
-

Tools and Skills Used

- **Tableau:** For building interactive dashboards and visualizing KPIs across multiple dimensions.

- **PowerPoint:** For presenting insights and recommendations in a concise, visual format.
- **Word:** For documenting methodology, findings, and strategic recommendations.

Skills Applied:

- Data Cleaning (changing column data types, fixing date formats using locale settings)
 - Data Visualization
 - KPI Analysis
 - Dashboard Design
-

Process Followed

The project followed a structured workflow:

1. **Metric Selection:** Identified core metrics—Sessions, Pageviews, Unique Pageviews, Bounces, and Time on Page—as the foundation for analysis. These metrics were chosen for their relevance to user engagement and marketing performance.
 2. **Dashboard Sheet Creation:** Designed four sheets, each focusing on a specific analytical perspective: Executive Overview, Traffic Source Analysis, Country & Device Performance, and Page-Level Engagement.
 3. **Chart Variety:** Incorporated bar charts, line graphs, area charts, pie charts, and stacked bar charts to represent data effectively. Each chart type was selected based on its ability to highlight specific insights.
 4. **Stakeholder Alignment:** Ensured each sheet addressed specific stakeholder needs, from high-level KPIs to detailed content analysis. For example, executives required KPI cards for quick decision-making, while analysts needed detailed breakdowns of traffic sources and page-level engagement.
-

Goals

The primary objective of this dashboard is to provide a consolidated, multi-stakeholder view of web performance across traffic sources, devices, and content. It aims to:

- Identify high-performing and underperforming pages based on user engagement and exit behaviour

- Track content relevance through time-on-page trends
 - Support marketing and SEO teams in optimizing traffic acquisition and retention
 - Enable data-driven decisions by visualizing key metrics across geographies and platforms
-

Key Performance Indicators (KPIs)

The dashboard is anchored on four core metrics that reflect user behaviour and content performance:

- **Unique Pageviews** : Measures how many sessions viewed a page at least once. Indicates content reach and popularity.
Example: Page Title 496 received 38,410 unique pageviews.
 - **Exits** : Tracks how often users leave the site from a specific page. High exits may signal UX or content issues.
Example: Page Title 473 had 7,986 exits (16.26% exit rate).
 - **Average Time on Page** : Reflects how long users spend on a page. A proxy for engagement and content relevance.
Example: Time on Page peaked at 254.5 seconds for certain content.
 - **Sessions by Source/Medium** : Breaks down traffic origin (e.g., Google Organic, Referral). Crucial for campaign and SEO performance.
Example: google.com.br / Referral drove 124,647 sessions.
-

Dashboard Screenshot

- **Executive Overview:** Provides a high-level summary of KPIs, including sessions, pageviews, bounce rate, and time on page. Designed for executives to quickly assess overall performance.

- **Traffic Source Analysis:** Visualizes sessions by source/medium and device category, highlighting top-performing channels and referral sources. Includes bounce rate trends to identify campaign effectiveness.

- **Country & Device Performance:** Compares engagement metrics across countries and device categories, using pie and area charts to highlight regional and platform-specific trends.

- **Page-Level Engagement:** Displays exits, unique pageviews, and time on page by individual page titles, helping content strategists identify high-performing and underperforming pages.

? Q&A Analysis

- **Q1: What is the overall bounce rate and what does it indicate?**

Ans. The total bounce count is 90,216 out of 418,062 sessions, yielding an approximate overall bounce rate of ~21.6%. Desktop accounts for 55,884 bounces from 292,287 sessions (~19.1%), mobile contributes 31,751 from 113,691 sessions (~27.9%), and tablet adds 2,581 from 12,084 sessions (~21.4%). The higher mobile bounce rate strongly suggests that the website's mobile experience, potentially page load speed or layout responsiveness requires urgent optimisation.

- **Q2: How does average time on page reflect user engagement?**

Ans. With an average time on page of 98 seconds, users are spending meaningful time-consuming content. This supports the effectiveness of page layout and content quality.

- **Q3: Which source medium drives the most sessions?**

Ans. Organic Search is by far the dominant traffic channel, contributing 44.59% of all pageviews as shown in the Pageviews by Channel Grouping pie chart. Direct traffic is the second-largest source at 23.89%, followed by Referral (12.15%) and Social (11.77%). Among specific referral sources, google.com.br/Referral drives the highest session volume at 124,647 sessions (with 15,228 mobile and the balance on desktop), followed by indiegogo.com/Referral at approximately 121,125 combined sessions. This confirms the critical importance of maintaining strong SEO performance as the primary growth lever.

- **Q4: How do bounce rates vary across traffic sources?**

Ans. Referral traffic from indiegogo.com shows a higher bounce rate compared to organic sources, indicating that some referral campaigns may need UX or landing page optimization.

- **Q5: Which country shows the highest engagement?**

Ans. The United States accounts for nearly 50% of unique pageviews and leads in session volume, suggesting strong regional relevance and targeting.

- **Q6: What device category dominates traffic?**

Ans. Desktop users represent over 70% of total sessions, indicating a preference for larger screens and suggesting that desktop optimization remains critical.

- **Q7: Which pages have the highest exit rates?**

Ans. Page Title 473 and 472 show elevated exit rates (16.26% and 9.02% respectively), signalling potential issues with content relevance or user flow.

- **Q8: Which pages demonstrate the strongest engagement?**

Ans. Page Title 496 leads in both unique pageviews and time on page, indicating that its content is highly engaging and well-structured.

Recommended Actions

- Reallocate budget toward high-performing channels like Google Organic Search to maximize ROI. Monitor bounce rate trends to identify campaign weaknesses and adjust strategies accordingly.
 - Redesign high-exit pages to improve retention. Promote content with high time on page and replicate successful formats across other pages. Conduct A/B testing to refine content strategies.
 - Optimize underperforming landing pages and refine keyword strategies based on bounce and exit data. Focus on technical SEO improvements to enhance site performance and search rankings.
 - Localize content for high-engagement regions such as the United States and India. Explore growth opportunities in emerging markets by tailoring content and campaigns to local preferences.
 - Enhance mobile optimization to improve user experience across all devices. Use dashboard filters to conduct regular performance reviews and ensure continuous improvement.
-

Conclusion

This project highlights the strategic value of web marketing dashboards in enabling data-driven decision-making. By consolidating key metrics into a unified, interactive format, the dashboard empowers stakeholders to monitor performance, identify trends, and take informed actions. The integration of Tableau for visualization, PowerPoint for presentation, and Word for documentation ensures that insights are not only accessible but also effectively communicated.

Ultimately, this project fosters a culture of continuous improvement and strategic alignment across marketing functions. It enables teams to make smarter, faster, and more impactful

decisions, driving enhanced user engagement, optimized marketing spend, and stronger digital strategy alignment. The dashboard serves as a practical tool that bridges the gap between raw data and strategic insight, ensuring that organizations remain agile and competitive in the digital marketplace.
